

EXECUTIVE SUMMARY

- MyStock is **not a SaaS competitor** — it's a **\$69 one-time Flutter source-code template** on CodeCanyon (7 sales, launched Apr 2026). It sells *code to developers*; Operix sells a *subscription to business owners*.
- Its feature set nearly mirrors Operix's **current desktop build** — both Flutter offline POS with products, stock, shifts, customers, roles. On the pure POS axis, differentiation is thin.
- Operix's moat lives one layer up: **multi-tenant SaaS + GL/accounting + Arabic-first RTL + MENA tax compliance** — things a \$69 template structurally cannot reach.

WHAT MYSTOCK IS

Product type	CodeCanyon source-code template (self-compile)
Tech stack	Flutter desktop · Windows-only · offline-first
Price	\$69 regular license (one-time)
Traction	7 sales · updated Apr 9 2026 · unproven
Backend	Local/offline · LAN multi-PC
Buyer	Developers / resellers, not end-shops

FEATURE COMPARISON

Capability	MyStock	Operix
POS · barcode · receipts	Yes	Yes
Product mgmt · bulk import	Yes	Partial
Stock · low-stock alerts	Yes	Yes
Shifts · cash reconcile	Yes	Yes
Customers · roles/RBAC	Yes	Yes
Arabic-first RTL	Generic	Yes
General Ledger / accounting	No	Yes
AR/AP invoicing	No	Yes
Tax/VAT (ZATCA/ETA)	No	Roadmap
Multi-tenant SaaS / cloud	No	Yes
Suppliers / purchasing	No	Yes
Offline / no-internet	Yes	Desktop only
One-time vs subscription	One-time	Recurring

WHERE MYSTOCK THREATENS

- Offline argument.** Intermittent connectivity in EG/KSA makes "zero internet" genuinely attractive.
- Price psychology.** "\$69 once" beats "EGP 1,499/mo" as a first objection (real end-cost is higher).
- Commoditization signal.** A \$69 Flutter POS template proves the offline-POS layer is now a commodity.

WHERE MYSTOCK CAN'T FOLLOW

- No accounting/GL, AR/AP, or tax compliance — can't become a compliant platform without becoming a different product.
- No SaaS economics — no recurring revenue, central updates, multi-location, or sync. Each install is an island.
- No true Arabic-first / MENA focus.
- No vendor accountability — email-only support, no refunds post-download, no bug fixes via comments.

RECOMMENDATIONS

- Reframe vs the category, not MyStock.** "A cash register is a commodity. Running your whole business in Arabic isn't."
- Neutralize offline.** Market local-first Postgres as "works offline, syncs to cloud" — best of both.
- Counter one-time pricing** with TCO: template + developer + no updates + no compliance » a subscription.
- Don't chase features.** POS already matches; invest the next cycle in GL depth, e-invoicing, multi-tenant cloud.
- Mine for UX only** — bulk import, low-stock alerts, shift reconciliation flows.

Strategic conclusion: MyStock is built in Flutter — a direct mirror of Operix's desktop app. The offline-POS layer is already commodity-grade; the entire differentiation budget should go to the SaaS / GL / Arabic-compliance layer a \$69 template can't reach.
